

A Supervising on methylation does not help genome-wide matched dimensionality, folds, ridge — only the target differs

B Both embeddings lose to a single scalar the 512-d vs 1-d gap is a variance effect, not a biology one

C The reimplementations reproduces R15 to the unit so the new arm's null result is not a coding difference

D Neither embedding recovers the assay's structure and A_meth's mild slope points the opposite way to R10
